L3 ANSWER 16 OF 22 DGENE COPYRIGHT 2007 The Thomson Corp on STN
AB The invention relates to a new isolated nucleic acid molecule (I)
encoding a tumorigenesis-related phosphoprotein designated
StarD10. The StarD10 gene can be used for treatment of
cancer. This sequence corresponds to predicted amino acid sequence of
the human tumorigenesis-related protein Q6Y365.

AB The authors have identified that StarD10, a member of the START
protein family, is overexpressed in both mouse and human breast tumors.
StarD10 was initially discovered on the basis of its
cross-reactivity with a phosphoserine-specific antibody in mammary tumors
from Neu/ErbB2 transgenic mice and subsequently isolated from SKBR3 human
breast carcinoma cells using a multistep biochem. purification strategy. The
authors have shown that StarD10 is capable of binding lipids.
StarD10 was overexpressed in 35% of primary breast carcinomas and
64% of human breast cancer cell lines, correlating with their ErbB2/Her2
status. Coexpression of StarD10 with ErbB1/epidermal growth
factor receptor in murine fibroblasts enhanced anchorage-independent
growth in soft agar, providing evidence for functional cooperation between

StarD10 and ErbB receptor signaling. Taken together, these data suggest that overexpression of this lipid-binding protein contributes to breast oncogenesis.

L3 ANSWER 13 OF 22 CAPLUS COPYRIGHT 2007 ACS on STN

AB The present invention relates generally to cancer therapy and cancer diagnostics and to agents useful therefor. More particularly, the present invention provides protein and cDNA sequences of a novel tumorigenesis-related phosphoprotein StarD10 isolated from SKBR3 human breast carcinoma cells, which is a member of the START protein family, is overexpressed in both mouse and human breast tumors. StarD10 is capable of binding lipids. StarD10 is overexpressed in 35% of primary breast carcinomas and 64% of human breast cancer cell lines, correlating with their ErbB2/Her2 status. Coexpression of StarD10 with ErbB1/epidermal growth factor receptor in murine fibroblasts enhances anchorage-independent growth in soft agar, providing evidence for functional cooperation between StarD10 and ErbB receptor signaling. Thus the overexpression of this lipid-binding protein contributes to breast oncogenesis. The present invention also provides diagnostic agents to detect the presence or absence of the tumorigenesis-related phosphoprotein or the presence or absence of an expressible tumorigenesis-related gene encoding the phosphoprotein. Such diagnostic agents are useful in determining the likelihood of development of a tumor in a vertebrate animal such as mammal and, in particular, a human. The diagnostic agents provided by the present invention may be used inter alia in screening and/or predicting the likelihood of development of neoplastic diseases such as but not limited to mammary cancer.

L3 ANSWER 11 OF 22 CAPLUS COPYRIGHT 2007 ACS on STN DUPLICATE 4
 AB A 35 kDa protein present in mammary tumors from Neu/ErbB2 transgenic mice
 was detected on the basis of its cross-reactivity with a
 phosphoserine-specific antibody against the transcription factor FKHR. To
 isolate this protein from cytosolic exts. derived from human breast
 carcinoma cells, we used free-flow electrophoresis in the first dimension
 to sep. proteins according to their charge, followed by reversed-phase
 high-performance liquid chromatog. (RP-HPLC) in the second and SDS-PAGE in
 the third dimension. Tryptic digests of Coomassie-stained bands were
 analyzed by nano-spray ionization-quadrupole quadrupole-time of
 flight-mass spectrometry identifying Stard10, a START domain
 containing protein, which cross-reacted with the anti-phospho-FKHR antibody.
 The site of phosphorylation was identified in immunoaffinity purified
 Flag-tagged Stard10 from 293T cells transiently expressing this
 protein. Tryptic phosphopeptides were enriched by immobilized metal
 affinity chromatog. (IMAC) and Stard10 Ser-259-phosphate was
 identified by tandem mass spectrometry. Thus, free-flow electrophoresis
 is a powerful high-capacity complementary technique to RP-HPLC and
 SDS-PAGE for the purification of proteins from complex cell lysates.
